## Modeling Data with Functions

GOAL Model data using quadratic, exponential, or power functions; use models to make predictions.
When a scatter plot shows that data do not fit a linear pattern, you may be able to use a nonlinear function to model the data.

## Three Types of Nonlinear Functions

Type of function
quadratic
exponential
power

## Form

$y=a x^{2}+b x+c$, where $a \neq 0$
$y=a b^{x}$, where $a \neq 0, b>0$, and $b \neq 1$
$y=a x^{b}$, where $a \neq 0$

## EXAMPLe 1 Finding a Quadratic Model

The table below gives the stopping distance $y$ (in feet) for a car traveling on a dry road at various speeds $x$ (in miles per hour).

| Speed, $\boldsymbol{x}(\mathbf{m i} / \mathbf{h})$ | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Stopping distance, $\boldsymbol{y}(\mathbf{f t})$ | 40 | 75 | 120 | 175 | 240 | 315 | 400 | 495 | 600 |

a. Find an equation of the quadratic function that models the data.
b. Predict the stopping distance for a car traveling at 65 miles per hour.

## SOLUTION

a. Plot the data pairs $(x, y)$ in a coordinate plane. Then draw the parabola or part of a parabola that you think best fits the data.
Estimate the coordinates of three points on the parabola, such as $(0,0),(60,250)$, and $(80,400)$.
Substitute the coordinates of the points into the model $y=a x^{2}+b x+c$ to obtain a system of three linear equations.

$$
\begin{aligned}
c & =0 \\
3600 a+60 b+c & =250 \\
6400 a+80 b+c & =400
\end{aligned}
$$

Solve the linear system. The solution is $a \approx 0.0417, b \approx 1.67$, and $c=0$.
A quadratic model for the data is $y=0.0417 x^{2}+1.67 x$.
b. To predict the stopping distance for a car traveling at 65 miles per hour, substitute 65 for $x$ in the quadratic model.

$$
y=0.0417(65)^{2}+1.67(65)=284.7325
$$

The stopping distance is about 285 feet.

## CHECK Example 1

1. Find an equation of the quadratic function that models the data.

| $\boldsymbol{x}$ | -6 | -2 | 0 | 1 | 3 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 20 | 4 | 1 | 2 | 6 | 17 |

Exponential Functions You can tell if an exponential function is a good model for a set of data $(x, y)$ by graphing the set of data $(x, \ln y)$. If the new set of data fits a linear pattern, then an exponential function is a good model for the original set of data.

## EXAMPLE 2 Finding an Exponential Model

The table below gives the value $y$ (in dollars) of a boat $x$ years after it was bought.

| $\boldsymbol{x}$ | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 12,000 | 9600 | 7700 | 6100 | 4900 | 3900 |

a. Find an equation of the exponential function that models the data.
b. Predict the value of the boat 7 years after it was bought.

## SOLUTION

a. First use a calculator to create a new set of data $(x, \ln y)$. The values of $\ln y$ are rounded to the nearest tenth.

| $\boldsymbol{x}$ | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln \boldsymbol{y}$ | 9.4 | 9.2 | 8.9 | 8.7 | 8.5 | 8.3 |

Then plot the new points as shown at the right. Sketch a line that appears to best fit the data. The points lie close to the line, so an exponential model is a good fit for the original data.
Choose two points that are on the line, such as $(0.5,9.3)$ and $(4,8.5)$. Use these points to find an equation of the line. Then solve for $y$.

$\ln y=-0.229 x+9.41 \quad$ Equation of line
$y=e^{-0.229 x+9.41} \quad$ Exponentiate each side using base e.
$y=e^{9.41}\left(e^{-0.229}\right)^{x} \quad$ Use properties of exponents.
$y \approx 12,200(0.795)^{x} \quad$ Simplify.
An exponential model for the data is $y=12,200(0.795)^{x}$.
b. To predict the value of the boat 7 years after it was bought, substitute 7 for $x$ in the exponential model.

$$
y=12,200(0.795)^{7} \approx 2450
$$

You can predict that the value of the boat will be about $\$ 2450$.

Power Functions You can tell if a power function is a good model for a set of data $(x, y)$ by graphing the set of data $(\ln x, \ln y)$. If the new set of data fits a linear pattern, then a power function is a good model for the original set of data.

## example 3 Finding a Power Model

The table below gives the population rank $x$ and the estimated population $y$ (in thousands) for the $\mathbf{9}$ most populated cities in the United States.

| $\boldsymbol{x}$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 8053 | 3903 | 2940 | 2088 | 1520 | 1457 | 1292 | 1271 | 1224 |

a. Find an equation of the power function that models the data.
b. Predict the population of the city in the United States that has a population rank of 12 .

## SOLUTION

a. First use a calculator to create a new set of data $(\ln x, \ln y)$ :

| $\ln \boldsymbol{x}$ | 0 | 0.69 | 1.1 | 1.4 | 1.6 | 1.8 | 1.9 | 2.1 | 2.2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln \boldsymbol{y}$ | 9.0 | 8.3 | 8.0 | 7.6 | 7.3 | 7.3 | 7.2 | 7.1 | 7.1 |

Then plot the new points as shown at the right. Sketch a line that appears to best fit the data. The points lie close to the line, so a power model is a good fit for the original data.

Choose two points that are on the line, such as $(0.4,8.6)$ and (2.1, 7). Use these points to find an equation of the line. Then solve for $y$.
$\ln y=-0.941 \ln x+8.98 \quad$ Equation of line

$\ln y=\ln x^{-0.941}+8.98 \quad$ Power property of logarithms
$\ln y=\ln x^{-0.941}+\ln e^{8.98} \quad \ln e^{x}=\log _{e} e^{x}=x$
$\ln y \approx \ln x^{-0.941}+\ln 7940 \quad$ Simplify.
$\ln y \approx \ln \left(7940 x^{-0.941}\right) \quad$ Product property of logarithms
$y \approx 7940 x^{-0.941} \quad \ln x=\ln y$ if and only if $x=y$.
A power model for the data is $y=7940 x^{-0.941}$.
b. To predict the population of the city in the United States that has a population rank of 12 , substitute 12 for $x$ in the power model.

$$
y=7940(12)^{-0.941} \approx 766
$$

You can predict that the population of the city is about 766,000 .

## CHECK Examples 2 and 3

Find an equation of the given type of function that models the data.
2. Exponential function

| $x$ | -4 | -2 | 0 | 2 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | -60 | -16 | -5 | -1 | -0.25 |

3. Power function

| $x$ | 1 | 2 | 3 | 4 | 5 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 6.3 | 4.4 | 3.5 | 3.4 | 2.7 | 2.3 |

## EXAMPLE 4 Using a Graphing Calculator to Find a Model

Use a graphing calculator to find a model for the data.

| $x$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 150 | 43 | 21 | 12 | 8 | 6 | 5 | 3 |

## SOLUTION

Step 1 Enter the $x$-values into L1 and the $y$-values into L2. Then graph the data in a scatter plot, as shown at the right.

It is difficult to tell whether the data fits an exponential model or a power model.

Step 2 Try finding an exponential model by entering the
 following keystrokes:

$$
\text { STAT } \square 0 \text { ENTER }
$$

An exponential model for the data is $y=131(0.604)^{x}$. The model is shown graphed with the data at the right.

Step 3 Now try finding a power model by entering the following keystrokes:

## STAT

$\square$ A ENTER

A power model for the data is $y=152 x^{-1.82}$. The model is shown graphed with the data at the right.

Because the power model passes near more of the data points, $y=152 x^{-1.82}$ is the best-fitting model for the data.

## CHECK Example 4

4. The table shows a town's population $y$ for various years $x$ since 1990. Use a graphing calculator to find a model for the data. Then predict the town's population in 2006.

| $\boldsymbol{x}$ | 0 | 2 | 4 | 6 | 8 | 10 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 3500 | 4050 | 4700 | 5300 | 6050 | 6900 | 7950 |

## EXERCISES

Make a scatter plot of the data. Then find an equation of the quadratic function that models the data.
1.

| $x$ | -6 | -4 | -2 | 0 | 2 | 4 | 6 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y$ | 11 | 9 | 5 | 2 | 1 | 1 | 3 | 6 |

2. 

| $\boldsymbol{x}$ | -6 | -4 | -2 | 0 | 2 | 4 | 6 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | -38 | -20 | -4 | 3 | -1 | -16 | -40 | -61 |

Make a scatter plot of the data. Then find an equation of the exponential function that models the data.
3.

| $x$ | -4 | -2 | 0 | 2 | 4 | 6 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y$ | 0.2 | 1 | 4 | 18 | 60 | 240 | 1000 |

4. 

| $x$ | -3 | -2 | -1 | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y$ | 14 | 10 | 8 | 6 | 4.5 | 3.2 | 2.5 | 2 |

Make a scatter plot of the data. Then find an equation of the power function that models the data.
5.

| $x$ | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}$ | 10 | 12 | 14 | 15 | 16 | 17 | 17.8 | 18.5 |

6. 

| $x$ | 1 | 3 | 5 | 7 | 9 | 11 | 13 | 15 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y$ | 1 | 7 | 21 | 43 | 75 | 117 | 150 | 202 |

In Exercises 7-10, use the table below, which gives the corn yield $y$ (in bushels per acre) that results from various nitrogen fertilizer rates $x$ (in pounds per acre).

| Fertilizer rate, $\boldsymbol{x}$ <br> (Ib/acre) | 90 | 100 | 110 | 120 | 130 | 140 | 150 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Corn yield, $\boldsymbol{y}$ <br> (bushels/acre) | 85 | 90 | 95 | 100 | 100 | 95 | 88 |

7. Make a scatter plot of the data.
8. Find an equation of the quadratic function that models the data.
9. Use the quadratic model to predict the corn yield for a nitrogen fertilizer rate of 145 pounds per acre.
10. What amount of nitrogen fertilizer do you think would maximize the corn yield? Explain your reasoning.

In Exercises 11-13, use the table below, which gives the saturation specific humidity $y$ (in grams per kilogram) for Earth's atmosphere at various temperatures $x$ (in degrees Celsius).

| Temperature, $\boldsymbol{x}\left({ }^{\circ} \mathbf{C}\right)$ | -40 | -30 | -20 | -10 | 0 | 10 | 20 | 30 | 40 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Saturation specific <br> humidity, $\boldsymbol{y}(\mathbf{g} / \mathbf{k g})$ | 0.1 | 0.3 | 0.75 | 2 | 3.5 | 7 | 14 | 26.5 | 47 |

11. Make a scatter plot of the data.
12. Find an equation of the exponential function that models the data.
13. Use the quadratic model to predict the saturation specific humidity at a temperature of $25^{\circ} \mathrm{C}$.

In Exercises 14-16, use the table below, which gives the population rank $x$ and the estimated population $y$ (in thousands) for the 9 most populated cities in Japan.
14. Make a scatter plot of the data.

| Population <br> rank, $\boldsymbol{x}$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Estimated population, $\boldsymbol{y}$ <br> (in thousands) | 8240 | 3495 | 2597 | 2190 | 1848 | 1530 | 1474 | 1471 | 1369 |

15. Find an equation of the power function that models the data.
16. Use the power model to predict the population of the city in Japan that has a population rank of 13 .

In Exercises 17 and 18, use the following table.

| Planet | Mean distance from Sun, <br> $\boldsymbol{x}$ (in millions of miles) | Rotation time around <br> Sun, $\boldsymbol{y}$ (in Earth years) |
| :--- | :---: | :---: |
| Mercury | 36 | 0.241 |
| Venus | 67 | 0.615 |
| Earth | 93 | 1.00 |
| Mars | 142 | 1.88 |
| Jupiter | 484 | 11.9 |
| Saturn | 891 | 29.4 |
| Uranus | 1785 | 83.8 |
| Neptune | 2793 | 164 |

17. Use a graphing calculator to find and graph a model for the set of data.
18. Pluto's mean distance from the Sun is $3,647,000,000$ miles. Predict Pluto's rotation time around the Sun.
19. Use a newspaper, magazine, reference book, or Web site to find a set of nonlinear paired data. Use a graphing calculator to find a model for the data. Then use your model to make a prediction about the corresponding $y$-value for an $x$-value that is not contained in your data set.
