LESSON
4.3

## Problem Solving Workshop: Using Alternative Methods <br> For use with the lesson "Write Linear Equations in Point-Slope Form"

Another Way to Solve Example 5
Multiple Representations In Example 5, you saw how to solve a problem about cost using rate of change. You can also solve the problem by working backwards.

PROBLEM Working Ranch The table shows the cost of visiting a working ranch for one day and night for different numbers of people. Can the situation be modeled by a linear equation? Explain. If possible, write an equation that gives the cost as a function of the number of people in the group.

| Number of people | 4 | 6 | 8 | 10 | 12 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Cost (dollars) | 250 | 350 | 450 | 550 | 650 |

METHOD Work Backwards You can solve the problem by working backwards.
STEP 1 Find the rate of change of the line connecting the points $(4,250)$ and $(12,650)$.
$m=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}=\frac{650-250}{12-4}=\frac{400}{8}=50$
Using $(4,250)$ and $(12,650)$, the cost increases at a rate of $\$ 50$ per person.
STEP 2 Write an equation in point-slope form using the slope and the point $(4,250)$. Let $C$ be the cost (in dollars) and $p$ be the number of people.

$$
\begin{aligned}
C-C_{1} & =m\left(p-p_{1}\right) & & \text { Write point-slope form. } \\
C-250 & =50(p-4) & & \text { Substitute } 50 \text { for } m, 4 \text { for } p_{1}, \text { and } 250 \text { for } C_{1} . \\
C & =50 p+50 & & \text { Solve for } C .
\end{aligned}
$$

An equation connecting the points $(4,250)$ and $(12,650)$ is $C=50 p+50$.
STEP 3 Substitute the other values in the table to see if they fall on the same line.

$$
\begin{array}{lll}
350 \stackrel{?}{=} 50(6)+50 & 450 \stackrel{?}{=} 50(8)+50 & 550 \stackrel{?}{=} 50(10)+50 \\
350=350 \checkmark & 450=450 \checkmark & 550=550 \checkmark
\end{array}
$$

1. Oranges The table shows the prices of different weights of oranges. Can the situation be modeled by a linear equation? Explain. If possible, write an equation that gives the total cost as a function of the pounds of oranges.
2. Fabric The table shows the prices of different lengths of fabric. Can the situation be modeled by a linear equation? Explain. If possible, write an equation that gives the total cost as

| Oranges (pounds) | 4 | 6 | 8 |
| :--- | :---: | :---: | :---: |
| Cost (dollars) | 4.60 | 6.90 | 9.20 |

| Fabric (yards) | 3 | 5 | 9 |
| :---: | :---: | :---: | :---: |
| Cost (dollars) | 22.25 | 33.75 | 45.25 |

## Algebra 1

# Problem Solving Workshop: Mixed Problem Solving 

For use with the lessons "Write Linear Equations in Slope-Intercept Form", "Use Linear Equations in Slope-Intercept Form", "Write Linear Equations in Point-Slope Form", and "Write Linear Equations in Standard Form"

1. Multi-Step Problem Ben jogs 6 miles in his first week. He runs 3 more miles every week for the next 8 weeks.
a. Write an equation that gives the total distance Ben jogged (in miles) as a function of weeks after the first week.
b. Find the distance that Ben runs 5 weeks after the first week.
2. Multi-Step Problem A carpet store charges $\$ 20$ per square yard of carpet after an initial installation fee. A customer paid a total of $\$ 800$ for 30 square yards.
a. Write an equation that gives the total cost of buying and installing a carpet as a function of the area of the room (in square yards).
b. Find the total cost of buying and installing 42 yards of carpet.
3. Multi-Step Problem The weekly cost of food for a family of four using the moderate cost plan in the United States increased at a relatively constant rate of $\$ 4.83$ per year from 1997 to 2004. In 2004, the weekly cost of food for a family of four was $\$ 186.90$.
a. What was the weekly cost of food for a family of four in 1997 ?
b. Write an equation that gives the weekly cost of food for a family of four as a function of the number of years since 1997.
c. Find the weekly cost of food for a family of four in 2010 assuming the same rate of increase.
4. Gridded Answer A website charges $\$ 12$ to buy a hat and a shipping charge of $\$ 5$ per order. Find the cost of buying 7 hats.
5. Open-Ended Describe a real-world situation that can be modeled by the function $y=2 x-3$.
6. Short Response One pound of chicken costs $\$ 3.50$ and one pound of ground beef costs $\$ 2.50$. Write an equation in standard form that models the possible combinations of pounds of chicken and pounds of ground beef that you can buy for $\$ 35$. Graph the equation. Explain what the intercepts of the graph mean in this situation.
7. Extended Response You are comparing the costs of moving companies for a truck rental. Company A charges $\$ 40$ to rent the truck plus $\$ .08$ per mile. Company B charges a flat fee of $\$ 50$ to rent the truck.
a. Write an equation in slope-intercept form that models the cost of renting a truck from each moving company.
b. Graph the two equations from part (a) on the same coordinate plane.
c. Under what conditions would the cost of renting a truck from either moving company be the same?
d. Under what conditions would the cost of renting a truck from Company A be the best deal? Under what conditions would it be cheaper for you to rent a truck from Company B?
8. Short Response A bowling alley has a shoe rental fee and a per game fee. The table shows the total cost (in dollars) of bowling for different numbers of games. Explain why this situation can be modeled by a linear equation. What is the shoe rental fee? What is the per game fee?

| Games | 2 | 4 | 6 | 8 |
| :--- | :---: | :---: | :---: | :---: |
| Total Cost | 6.50 | 10.50 | 14.50 | 18.50 |

9. Open-Ended Bananas cost $\$ .40$ per pound and pears cost $\$ 1$ per pound. Write an equation in standard form that models the possible combinations of bananas and pears that you can buy with a certain amount of money (in dollars). List three possible combinations.
