## Skills Readiness

## Identify Polygons

Definition: A polygon is a closed plane figure with at least three sides, none of which intersect other than at their endpoints.
Examples:
Not a polygon
Polygon

A polygon can be classified by its number of sides according to the table.
Definitions:
An equilateral polygon has all sides congruent.
An equiangular polygon has all angles congruent.
A regular polygon has all sides congruent and all

| Number of Sides | Polygon |
| :---: | :---: |
| 3 | triangle |
| 4 | quadrilateral |
| 5 | pentagon |
| 6 | hexagon |
| 7 | heptagon |
| 8 | octagon |
| 9 | nonagon |
| 10 | decagon |
| 12 | dodecagon |
| $n$ | $n$-gon | angles congruent; that is, it is both equilateral and equiangular.

## Practice on Your Own

Determine whether each figure is a polygon. If so, name it by its number of sides. Circle each figure that is a regular polygon.
